

# FOLDABLE SAFETY STRUCTURE

Our foldable safety structure is a cost-efficient solution when operations are needed only for one tank section of a truck during the loading or unloading process. This safety structure is designed to improve the occupational safety when working at height.

The safety structure will be customized to fit perfectly for the surrounding environment and to work with the vehicle fleet in use. The height of the platform, the size of the safety structure and the geometry of the foldable stairs can be customized. The safety structure moves with pneumatics and is operated via control panel at the platform. This safety structure can also be installed to an existing platform.

The safety structure is manufactured from sturdy structural steel. It is a CE marked product according to EU directive of machinery 2006/42/EC. The platform and the railings of the safety frame are designed according to the EN ISO 14122-3:2016 standard. The versions fulfilling EX requirements are available upon request.
